Queries and Clarifications	5
Question 1 ISS : Please provide a clear breakdown of roles and responsibilities between your organisation (as the CRM principal vendor) and the SI across each implementation phase (e.g., design, build, integration, testing, deployment, and support).	6
Question 2 ISS : Please provide 2–3 detailed project examples where you worked with a third-party SI (independent from your organisation). For each example, your response must clearly cover:	14
Question 3 GCFS Functional : For service request, possible to auto assigned the case to the resolver team with pre-defined SLA?	20
Question 4 GGB Functional : Does CRMNext have a feature to generate pitchbooks? Where is this feature located?	21
Question 5 GGB Functional : From the respective key personnels or director listed in the client's shareholding structure, is the 360-view able to show whether the corporate individual is a CFS Wealth client? It is good insights for client coverage to cross sell any potential private wealth that leads to CFS	22
Question 6 GGB Functional : Can the CRM provide a "Reciprocal Relationship Ecosystem View"? For example, while Petronas is a client of Maybank, Maybank may also be a customer of Petronas. Such a view would enable Management to assess the overall strategic value of the relationship by comparing revenue generated from the client against the organization's spend with the same entity.	23
Question 7 GCFS Functional : Mortgage is changing/upgrading our Loan origination system. Some product will reside in old system, and some products are residing at new system. FYI we also have channels (e.g. sales for you) for mortgage onboarding process... How will the integration look like?	24
Question 8 GCFS Functional : For these requirements:	25
Question 9 GCFS Functional : For these requirements:	26
Question 10 GCFS Functional : Could you clarify whether module scope can be tailored by country during implementation? For example, can some countries adopt only a subset of modules while others implement a broader scope?	26
Question 11 GCFS Functional : Could you please share the proposed user access matrix for the system?	27
Question 12 GCFS Functional : For customer key information screen, if business would like to add more fields what is your recommendation? Does it require source codes change?	29
Question 13 GCFS Functional : Based on the fictitious scenario below, demonstrate how the CRM platform manages a complex complaint journey spanning multiple months, channels, business units, investigation teams, and external regulators; evolving from a service request to complaint, while maintaining:	30

Question 14 Tech : Do you have any local based support team in MY, SG and Indonesia for the purpose of project implementation/support? – preferably on-site	32
Question 15 Tech : If the bank decided to go with the approach of zero-copy for data, will the native AI functionality still work?	33
Question 16 Tech : Is your proposed solution running only on single CSP or running on multiple CSPs?.....	34
Question 17 GCFS Functional : Wanted to understand why Business Next is not featured in the 2025 Gartner and IDC reports for CRM Customer Engagement.	35
Question 18 GCFS Functional : What is "Disposition" and "Child Service Request"?	36
Question 19 GCFS Functional : What is the underlying AI engine being used in the Business Next CRM platform? Understood from the start of the presentation that the underlying AI is not Copilot and ChatGPT.....	37
Question 20 GCFS Functional : When staff updates a customer's address in the CRM platform, will the system also update the details in our core banking system?.....	37
Question 21 GCFS Functional : In the Forrester Wave report, Partner Ecosystem for Business Next was rated as "1". Can you please explain what is this and the reason for the rating?.....	38
Question 22 GCFS Functional : How can we group related cases (Service Requests and Complaints) together so we can have an end-to-end view of a complaint?.....	38
Question 23 GCFS Functional : What differentiates your CRM platform from competing solutions in terms of its Complaints Management capabilities/functionalities?	39
Question 24 GCFS Functional : What is the accuracy rate of your AI-driven complaint categorisation capability? Specifically, how accurately can the AI classify complaints into the appropriate taxonomy categories at both the Major (Parent) category level and Minor (Child) sub-category levels?.....	41
Question 25 GCFS Functional : How do you group related cases (service requests and/or complaints) together in an audit trail for a single case? For example, customer makes multiple calls over several months on the same issue, how do we link these cases together?	42

Queries and Clarifications

This document has been prepared to formally address the queries and clarifications raised by Maybank during the Bid Defense & POC session conducted between 18th June 2026 to 23rd June 2026. The responses outlined herein provide detailed explanations aligned with the bank's requirements, covering functional capabilities, technical capabilities, AI use cases, configurability, integration approach, and implementation considerations.

The objective of this document is to ensure clarity, completeness, and a shared understanding of the proposed solution, while also serving as a reference for follow-up discussions and evaluations. Each response has been structured to reflect practical deployment experience, scalability, and alignment with regulatory and operational expectations of Indian banking institutions.

Question 1 | ISS : Please provide a clear breakdown of roles and responsibilities between your organisation (as the CRM principal vendor) and the SI across each implementation phase (e.g., design, build, integration, testing, deployment, and support).

In your response, please explicitly cover:

- ▽ Ownership model (e.g., who is accountable vs responsible) by phase
- ▽ Key deliverables owned by each party (e.g., solution architecture, integration design, configuration, data migration)
- ▽ Decision rights (e.g., who drives design authority, customization approvals, architecture standards)- Dependency management and handoff points, including how misalignment is prevented
- ▽ Extent of principal/vendor involvement during build vs SI-led delivery
- ▽ Role in quality assurance (e.g., code reviews, design validation, adherence to platform best practices)

BUSINESSNEXT Response:

BUSINESSNEXT adopts a structured and governed multi-party delivery model for Maybank's PROJECT ONE CX, where Maybank, BUSINESSNEXT (CRM Principal/OEM), and the appointed System Integrator (SI) shall collaborate under a clearly defined phase-wise RACI, a centralized CRM Design Authority, and formal governance checkpoints. While the SI leads the overall enterprise programme delivery, BUSINESSNEXT, as the OEM, retains ownership and accountability for all CRMNEXT-related deliverables, architecture, and product quality.

1. Delivery Ownership across Project Phases

Project Phase	BUSINESSNEXT	System Integrator (SI)	Maybank
Discovery & Design (IDR)	Responsible/Accountable for CRM solution architecture, application design and integration architecture	Responsible for Target Operating Model (TOM), enterprise architecture, change impact assessment and programme coordination	Accountable for business requirements, validation and sign-off
Build (Configuration & Custom Development)	Responsible & Accountable for all CRMNEXT configuration, approved customizations and application development	Consulted	Consulted
Integration	Responsible/Accountable for CRM APIs, interface mappings, adapters and CRM-side integration components	Responsible for enterprise integration coordination	Accountable for source system readiness, connectivity and interface availability
Data Migration	Consulted on CRM target data model and migration validation	Responsible for migration strategy, ETL execution and reconciliation	Accountable for data ownership, cleansing and data quality
Testing	Supports SIT and UAT; owns CRM product testing and defect resolution	Responsible for SIT execution	Responsible & Accountable for UAT and business acceptance

Deployment & Cutover	Responsible for CRM application release and deployment activities	Responsible for cutover planning, execution and coordination	Accountable for production readiness and Go/No-Go approval
Post Go-Live Support	Responsible & Accountable for L3 Product Support as CRM OEM	Responsible for L1/L2 Support (where applicable)	May undertake L1/L2 support (if hosted within Maybank Azure Landing Zone) or via the SI

Table 1: Delivery Ownership Across Bank OEM and SI Partner

2. Ownership of Key Deliverables

BUSINESSNEXT (CRM Vendor)

- BUSINESSNEXT owns all CRMNEXT product deliverables, including:
- CRM Solution Architecture
- CRM Integration Architecture
- CRM Configuration
- Approved Product Customizations
- CRM-side APIs, Adapters and Interface Mappings
- Product Enhancements
- Product-level Testing
- Defect Resolution
- CRM Release Management
- L3 Product Support
- Product Roadmap Alignment

System Integrator (SI)

- SI is responsible for enterprise program execution, including:
- Program Management
- Enterprise Architecture
- Target Operating Model (TOM)
- Organizational Change Management
- Data Migration Strategy & Execution
- System Integration Testing (SIT)
- Cutover Planning & Go-Live Coordination
- L1/L2 Application Support (where applicable)

Maybank

- Maybank remains accountable for business ownership, including:
- Business Requirement Validation
- Business Process Sign-off
- User Acceptance Testing (UAT)

- Data Ownership & Data Quality
- Operational Readiness
- Production Go-Live Approval

Below is an updated single consolidated RACI Matrix aligned with the proposed Maybank PROJECT ONE CX delivery model, where:

- BUSINESSNEXT acts as the CRM Principal/OEM, owning all CRM product architecture, configuration, integrations within CRM scope, releases and L3 support.
- System Integrator (SI) leads the overall transformation program, enterprise solution, data migration, SIT, cutover and L1/L2 support.
- Maybank owns business decisions, governance, infrastructure (where applicable), UAT, data ownership and Go-Live approvals.

Table 2 : RACI Matrix of Project One CX

Please Note: If CRMNEXT is deployed within Maybank's Azure Landing Zone, L1/L2 support may be provided either by Maybank or the appointed SI, while BUSINESSNEXT continues to provide OEM-owned L3 support. This aligns with BUSINESSNEXT's standard enterprise delivery model.

3. Design Authority & Decision Governance

A centralized BUSINESSNEXT Design Authority governs all CRMNEXT solution decisions.

The Design Authority is led by:

- BUSINESSNEXT Product Head
- Product Architects
- Integration Architects
- Security Specialists

The Design Authority is responsible for:

- CRM product architecture decisions
- Determining whether requirements are delivered through:
 - Standard Configuration
 - Standard Product Enhancement
 - Approved Custom Development
- Reviewing all deviations from CRMNEXT standard architecture
- Ensuring alignment with CRMNEXT platform standards and roadmap

Any customization or architectural deviation from the standard CRMNEXT platform requires formal approval from the BUSINESSNEXT Design Authority.

Additionally, all Commercial and scope-related decisions will be jointly governed through a Change Control Board (CCB) comprising representatives from Maybank, BUSINESSNEXT, and SI.

4. Dependency Management & Phase Handoffs

To ensure seamless collaboration and eliminate ownership ambiguity, the project follows defined governance checkpoints.

Key dependency management practices include:

- Finalization of the project RACI and role composition prior to IDR commencement.
- Formal Design Sign-off serving as the transition gate between Discovery and Build.
- BUSINESSNEXT delivers configured and unit-tested CRM modules to the SI for SIT.
- SI handing over validated builds to Maybank for UAT.
- Clearly documented Entry and Exit Criteria for every project phase.

Cross-team alignment is maintained through:

- Regular Design Authority Reviews
- Change Control Board (CCB)
- Shared Integration & Interface Control Documents
- Governance checkpoints across IDR, SIT, UAT, Cutover and Go-Live

5. Extent of BUSINESSNEXT vs SI Involvement

BUSINESSNEXT Led Activities

BUSINESSNEXT exclusively owns the CRM application build using a Configuration-First implementation approach, typically comprising:

- Approximately 95% configuration
- Approximately 5% targeted customizations

This approach minimizes implementation risk while preserving platform upgradeability and long-term maintainability.

BUSINESSNEXT is responsible for:

- CRM Configuration
- Product Extensions
- Integration Components
- Product Testing
- Release Management

SI-Led Activities

The SI primarily leads:

- Program Governance
- Enterprise Coordination
- Cross-system Integration Management
- Data Migration
- Enterprise Architecture
- Organizational Change Management

with BUSINESSNEXT providing consultation and product expertise where required.

Joint Activities

The following phases are jointly executed:

- Interactive Design Review (IDR)
- System Integration Testing (SIT)
- User Acceptance Testing (UAT)
- Cutover Planning
- Go-Live Readiness

This shared governance model ensures coordinated delivery with clearly defined accountability across all stakeholders.

6. Quality Assurance & Solution Governance

As the CRM Vendor, BUSINESSNEXT owns product quality and architectural compliance throughout the implementation lifecycle.

Quality assurance activities include:

- Product level testing of all CRMNEXT deliverables.
- Review of all configurations and customizations for compliance with CRMNEXT's metadata-driven low-code/no-code architecture.
- Code reviews for all approved custom developments.
- Integration validation by BUSINESSNEXT Integration Architects.
- Security reviews performed by BUSINESSNEXT Security Specialists.
- Design reviews conducted by the BUSINESSNEXT Design Authority prior to implementation.
- Periodic architecture assessments to ensure continued alignment with CRMNEXT product standards, roadmap, and future upgradeability.

This governance framework ensures that the delivered solution remains compliant with CRMNEXT best practices while preserving long-term maintainability, scalability, and supportability.

Question 2 | ISS : Please provide 2–3 detailed project examples where you worked with a third-party SI (independent from your organisation). For each example, your response must clearly cover:

- ▽ Role split between Principal and SI across phases
- ▽ Key delivery challenges encountered (e.g., misalignment on design, integration complexity, delays, quality issues)
- ▽ Specific failure points or breakdowns (e.g., rework required, performance issues, non-scalable design, governance gaps)
- ▽ How these issues were resolved, including corrective actions taken
- ▽ Mechanisms used to safeguard platform integrity (e.g., design authority controls, governance checkpoints, certification requirements, architecture reviews)
- ▽ Examples where SI-led implementation deviated from best practices, and how the issue was identified and resolved

BUSINESSNEXT Response:

BUSINESSNEXT has successfully delivered multiple large-scale banking CRM transformation programs under System Integrator (SI)-led delivery models, where the SI managed the broader transformation program while BUSINESSNEXT acted as the CRM Principal/OEM. Across these engagements, BUSINESSNEXT retained ownership of the CRM solution architecture, platform integrity, configuration, and product quality, while working collaboratively with leading global SI partners.

The following representative implementations illustrate the delivery model, ownership structure, project challenges, governance mechanisms, and quality controls adopted by BUSINESSNEXT.

Case Study 1: Leading Public Sector Bank, India (System Integrator: Tech Mahindra)

Project Phase	BUSINESSNEXT	Tech Mahindra
Discovery & Design (IDR)	CRM solution architecture and design	Requirements gathering, program governance
Build	CRM configuration and product enhancements	Program coordination
Integration	CRM APIs and interface development	Enterprise integration
Testing	UAT support	SIT execution
Deployment	CRM application release	Program-managed cutover
Support	OEM L3 Support	L1/L2 Support

Table 3 : Largest CRM Implementation RACI

This engagement represents one of the world's largest banking CRM implementations.

Key Delivery Challenges

- Coordinating multiple parallel workstreams across a large banking transformation program.
- Managing dependencies between the SI's enterprise architecture/TOM activities and CRM configuration timelines.
- Aligning numerous integrated applications and stakeholder groups throughout delivery.

Delivery Risks Encountered

During the early discovery phase, the significant volume of business requirements created a potential risk of:

- Scope expansion
- Design drift
- Misalignment between SI-owned Target Operating Model (TOM) decisions and CRM solution design

Without structured governance, these could have resulted in substantial downstream rework.

Resolution & Corrective Actions

BUSINESSNEXT established:

- A dedicated CRM Design Authority
- Regular joint architecture review sessions
- Formal design approval gates between requirements finalization and CRM configuration

These controls ensured alignment before building activities commenced.

Platform Integrity Controls

Throughout the implementation BUSINESSNEXT maintained:

- Configuration-first implementation governance
- Mandatory architecture reviews before any customization
- OEM approval for all product-level changes

Case Study 2: Global Financial Institution (System Integrator : IBM)

Project Phase	BUSINESSNEXT	IBM
Discovery & Design	CRM solution design	Enterprise program management
Build	CRM configuration	—
Integration	CRM interfaces and APIs	Enterprise and Core Banking integration
Testing	CRM support	SIT execution
Deployment	CRM release	Programme governance
Support	OEM L3 Support	L1/L2 Support

Table 4 : Regulatory Bank of India, Implementation Scope

Key Delivery Challenges

The primary challenge involved coordinating integration sequencing across:

- Multiple Core Banking platforms
- Enterprise channels
- Third-party applications

all being delivered in parallel by IBM while CRM implementation was progressing.

Delivery Risks Encountered

Following commencement of CRM configuration, several interface specifications evolved, creating risks of:

- Integration redesign
- CRM rework
- Project schedule slippage

Resolution & Corrective Actions

To address these challenges:

- Joint Integration Design Workshops were established.
- A shared Interface Control Document (ICD) was maintained.
- BUSINESSNEXT Integration Architects validated every interface modification before implementation.

Platform Integrity Controls

BUSINESSNEXT ensured:

- Formal certification of interface designs
- Architecture validation by the Integration Architecture team
- Change Control approval before implementation of interface modifications

Case Study 3: Financial Institution Transformation Program (System Integrator: DXC Technology)

Project Phase	BUSINESSNEXT	DXC Technology
Discovery & Design	CRM solution design	Program coordination
Build	CRM configuration	—
Integration	CRM integration	Enterprise coordination
Testing	Ownership of CRM test results	Overall testing governance
Deployment	CRM application release	Change management
Support	OEM L3 Support	L1/L2 Support

Table 5 : One of the Top 10 Public Sector Bank of India's Implementation

Key Delivery Challenges

The implementation required careful coordination of:

- SI-led System Integration Testing (SIT)
- CRM-specific test execution
- Readiness of multiple dependent systems

Delivery Risks Encountered

Delays in SI-managed test environment readiness created the risk of:

- Reduced CRM testing duration
- Compressed regression cycles
- Potential impact to Go-Live timelines

Resolution & Corrective Actions

BUSINESSNEXT and DXC jointly introduced:

- Test readiness checklists
- Structured escalation mechanisms
- Re-prioritized CRM regression testing

This ensured that project timelines were maintained without compromising product quality.

Platform Integrity Controls

BUSINESSNEXT retained:

- Ownership of CRM product quality
- Final approval of CRM testing outcomes
- Authorization before progression into User Acceptance Testing (UAT)

Governance Mechanism User Across SI-Led Engagements

Across all SI-led implementations, BUSINESSNEXT consistently applies a standardized governance framework to safeguard CRMNEXT platform integrity and ensure adherence to product standards.

CRM Design Authority

BUSINESSNEXT retains ownership of:

- CRMNEXT solution architecture
- Product configuration
- Technical design decisions

irrespective of the appointed System Integrator.

Change Control Board (CCB)

A joint Change Control Board comprising Maybank (or customer), BUSINESSNEXT, and the SI governs:

- Scope changes
- Product customizations
- Commercial decisions
- Design deviations

Configuration–First Delivery Approach

BUSINESSNEXT follows a proven implementation philosophy consisting of:

- Approximately 95% configuration
- Approximately 5% targeted customization

This minimizes deviations from the standard CRMNEXT platform while preserving upgradeability and reducing long-term technical debt.

Architecture Review & Certification Gates

All deviations from standard CRMNEXT architecture are subject to:

- Design Authority review
- Technical assessment
- Formal BUSINESSNEXT approval

before implementation proceeds.

Example of SI-Proposed Design Deviation Corrected By BUSINESSNEXT

During one SI-led engagement, the System Integrator proposed a workaround involving custom code outside the standard CRMNEXT configuration framework to accelerate delivery timelines.

During the BUSINESSNEXT Design Authority review, this approach was identified as introducing risks related to:

- Future platform upgrades
- Maintainability
- Technical debt

Rather than approving the customization, BUSINESSNEXT collaborated with the SI to redesign the requirement using the standard CRMNEXT configuration framework.

The revised solution achieved the original business objective within the planned delivery timeline while:

- Preserving platform upgradeability
- Eliminating unnecessary technical debt
- Maintaining full compatibility with future CRMNEXT product releases

This example demonstrates BUSINESSNEXT's governance model, where platform integrity and long-term maintainability are protected without compromising delivery commitments.

Question 3 | GCFS Functional : For service request, possible to auto assigned the case to the resolver team with pre-defined SLA?

BUSINESSNEXT Response:

Yes, CRMNEXT supports configurable, rules-based auto-assignment of Service Requests and Complaints to the appropriate team, role, queue, or individual user based on the bank's business strategy. Assignment rules can be configured using multiple criteria such as geography, branch, queue, user skills, product, service request category/sub-category, customer segment, priority, status, working calendars, holidays, and other business-specific parameters. This enables intelligent workload distribution, faster routing, and optimized service operations.

In addition, CRMNEXT provides configurable Service Level Agreement (SLA) management, allowing different response and resolution timelines to be defined based on request category, sub-category, sub-sub-category, mapping in a service request or complaint. The platform continuously monitors SLA compliance, triggers automated escalations, notifications, and reassignment workflows when thresholds are breached, ensuring timely resolution and adherence to the bank's service standards.

Question 4 | GGB Functional : Does CRMNext have a feature to generate pitchbooks? Where is this feature located?

BUSINESSNEXT Response:

Yes, CRMNEXT provides a Template Management capability that enables the generation of standardized pitchbooks using configurable templates. Product-specific pitchbook templates can be created and maintained centrally, allowing users to generate personalized pitchbooks directly from the Corporate 360 view through a custom action, contextual button, or an Action Center journey. Customer and product information can be dynamically populated into the template, ensuring consistency while reducing manual effort.

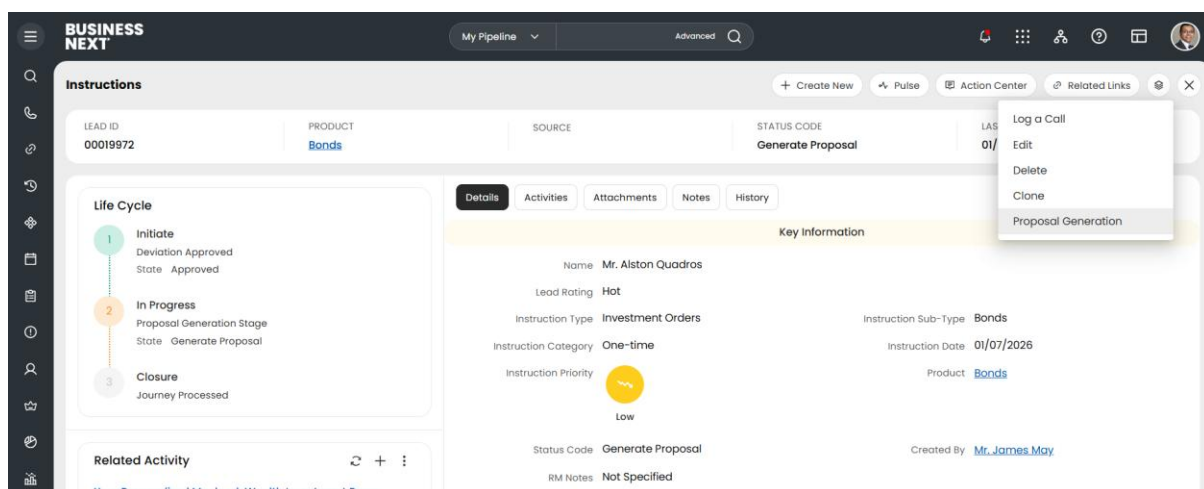

Figure 1: Pitch Book Generation Functionality

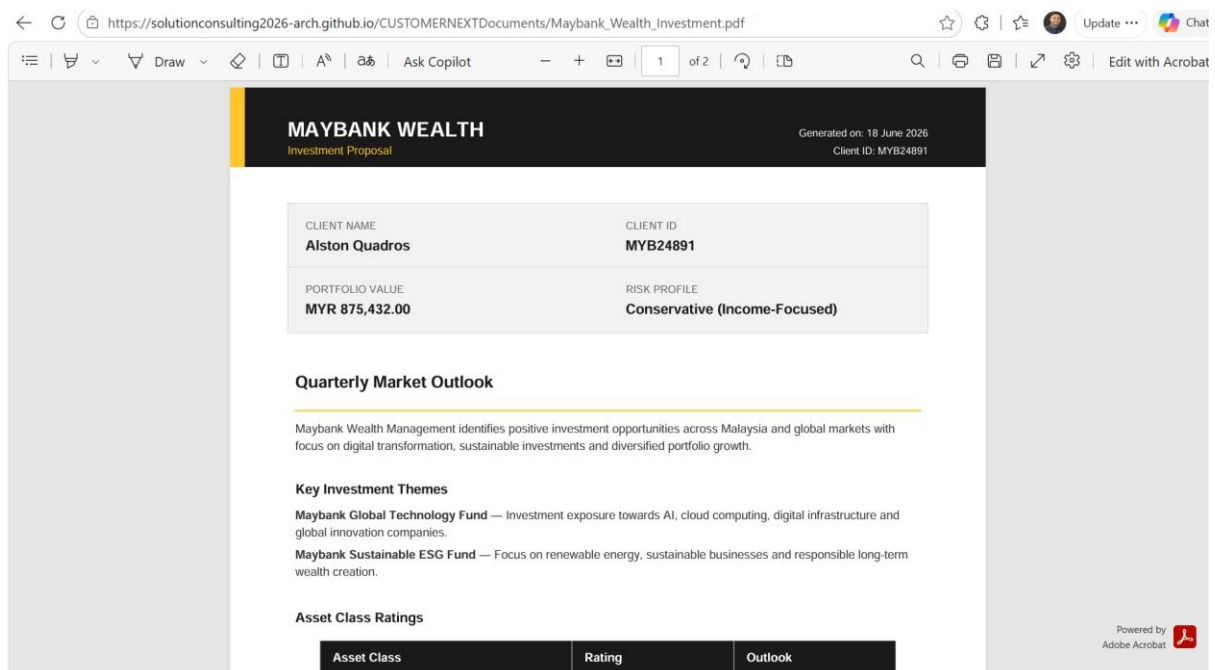

Figure 2: Sample Pitchbook Generated from System

Question 5 | GGB Functional : From the respective key personnels or director listed in the client's shareholding structure, is the 360-view able to show whether the corporate individual is a CFS Wealth client? It is good insights for client coverage to cross sell any potential private wealth that leads to CFS

BUSINESSNEXT Response:

Yes, CRMNEXT can support this use case through its Corporate 360, Contact Management and Relationship Management capabilities, provided the relevant wealth customer data is available for integration. Where an individual identified within a corporate shareholding or relationship hierarchy is also a CFS Wealth client, CRMNEXT can surface this insight within the Customer 360 view, enabling relationship managers to identify cross-sell and collaboration opportunities.

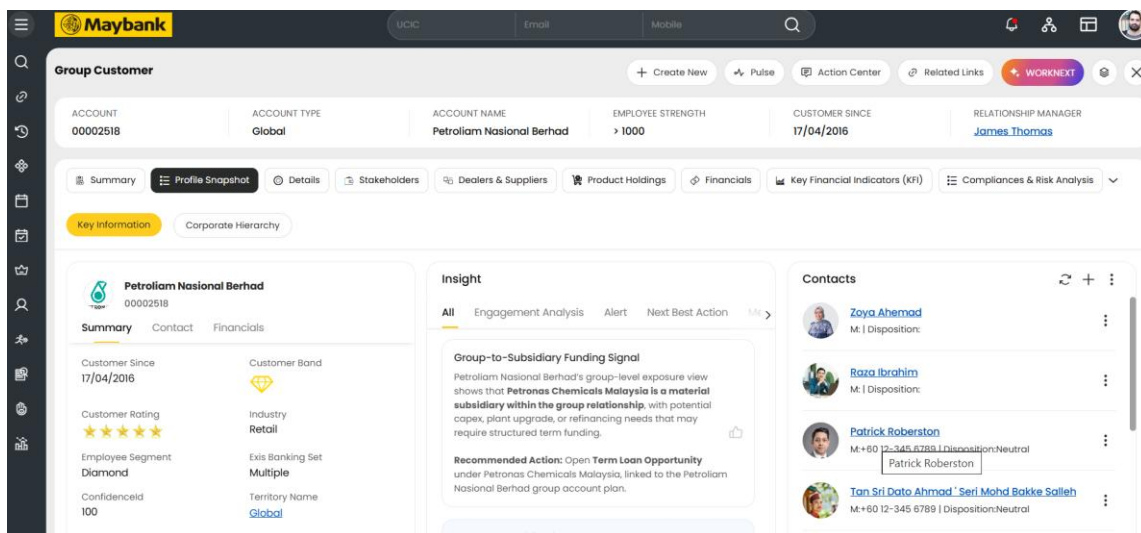

Figure 3 : Corporate 360 with Director

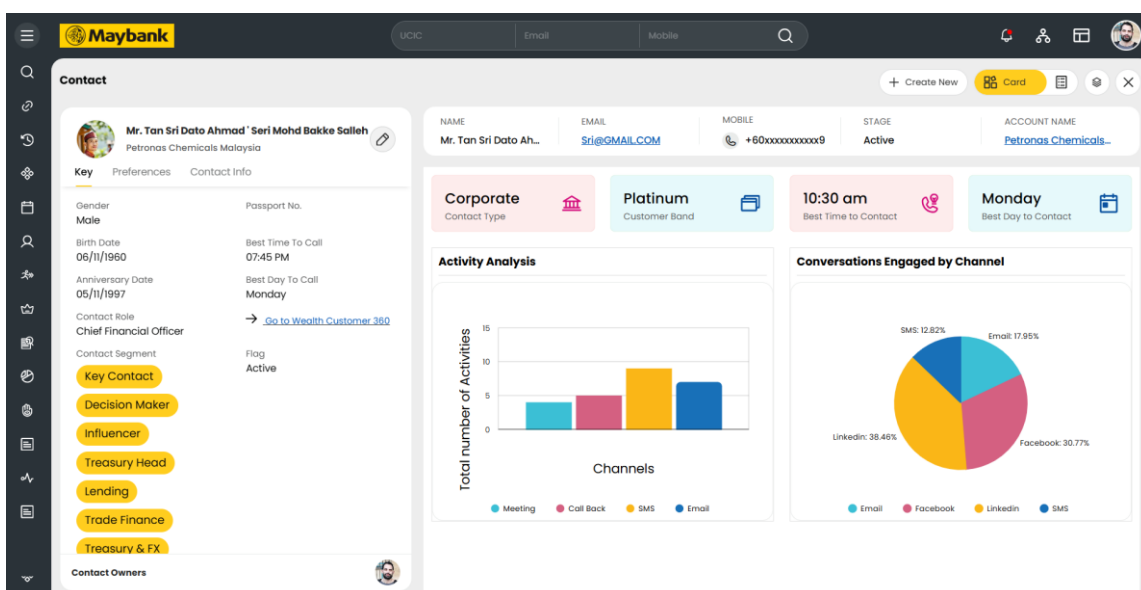

Figure 4 : Same Director as CFS Wealth Customer 360

Question 6 | GGB Functional : Can the CRM provide a “Reciprocal Relationship Ecosystem View”? For example, while Petronas is a client of Maybank, Maybank may also be a customer of Petronas. Such a view would enable Management to assess the overall strategic value of the relationship by comparing revenue generated from the client against the organization's spend with the same entity.

This would offer a 360° enterprise relationship view, helping Management identify:

- ▽ Strategic clients with significant mutual value
- ▽ Reciprocal dependencies between both organizations
- ▽ Anchored relationships that are strategically important across multiple business dimensions

Ultimately, this provides a more holistic perspective of the net strategic relationship rather than a purely client-centric view.

BUSINESSNEXT Response:

Yes, CRMNEXT supports a reciprocal relationship ecosystem view through its customer 360, Hierarchy Management and Single Entity Architecture capabilities. The platform can model entities in multiple business roles (e.g., a corporate customer that is also a supplier or strategic partner) and present a consolidated enterprise relationship view. Where the relevant data is available within Maybank's systems—or can be made available through APIs or integration interfaces—CRMNEXT can aggregate and visualize customer relationships, product holdings, transactional information, and reciprocal business interactions in a single view.

Question 7 | GCFS Functional : Mortgage is changing/upgrading our Loan origination system. Some product will reside in old system, and some products are residing at new system. FYI we also have channels (e.g. sales for you) for mortgage onboarding process... How will the integration look like?

BUSINESSNEXT Response:

CRMNEXT is designed to operate in heterogeneous application environments and can seamlessly support this coexistence model through its configurable workflow and integration framework. Workflow routing can be configured based on business parameters such as product type, mortgage scheme, channel, or any other business rule defined by Maybank. For products that continue to reside on the existing LOS, CRMNEXT will automatically route the application to the legacy LOS. Similarly, for products onboarded to the new LOS, the workflow will route the application to the new platform. This routing is entirely configuration-driven using CRMNEXT's workflow and business rules engine, requiring no code changes to the application. This enables Maybank to execute a phased migration strategy while providing users across channels (e.g., Sales For You) with a consistent onboarding experience, regardless of the underlying LOS handling the application.

Question 8 | GCFS Functional : For these requirements:

2.124 Feedback Management -> Ability to escalate the case to other LOB in real time basis.

Additional notes (CXM MBI): – Ticket flow are pre-defined based on agreed memo (included Handler and SLA)

Questions: the escalation can be sent through email to e.g LOB team that may not have CRM account?

BUSINESSNEXT Response:

Yes, CRMNEXT supports real-time, configuration-driven case escalation to other Lines of Business (LOBs), including teams that do not have CRMNEXT user accounts. Through its workflow engine and email integration capability, the system can automatically trigger email-based escalations to predefined distribution lists or individual recipients based on configurable business rules such as case category, sub-category, priority, SLA status, or escalation matrix.

The escalation email can be configured to include all relevant case information, including the case reference number, customer details, issue summary, priority, SLA timelines, attachments, and any supporting remarks, enabling the recipient LOB to take immediate action without requiring access to CRMNEXT. In addition, the workflow records the escalation event, timestamps, recipient details, and subsequent status updates within the case history, providing a complete audit trail. If the external LOB responds via an agreed integration mechanism (e.g., API, email processing, or enterprise workflow system), CRMNEXT can update the case status and continue tracking the end-to-end lifecycle while ensuring adherence to the predefined handler assignments and SLA commitments. This allows Maybank to maintain a single, governed service process even when certain operational teams might reside outside the CRM platform.

Question 9 | GCFS Functional : For these requirements:

3.19 IVR Support the search and retrieval of IVR Transaction Records with filter, Sort and export functions [SG]

Questions: you put as Partially Comply, because BUSINESSNEXT cannot directly search on the IVR Transaction records, but BUSINESSNEXT natively can consume that log right? and those transaction records from IVR can be transform to data that can be filter, sort, processed?

BUSINESSNEXT Response:

Yes, CRMNEXT can integrate with the bank's IVR platform to consume IVR transaction records through APIs, event streams, or batch interfaces. Once the IVR transaction data is ingested into CRMNEXT, it can be mapped to the CRM data model and made available for filtering, sorting, searching, reporting, and export through the platform's standard search and reporting capabilities. The ingested IVR data can also be leveraged to trigger workflows, generate alerts and enrich the Customer 360 view.

Question 10 | GCFS Functional : Could you clarify whether module scope can be tailored by country during implementation? For example, can some countries adopt only a subset of modules while others implement a broader scope?

Also, how would this affect the commercial model? Would a reduced module scope lead to lower licensing, implementation, or support costs?

BUSINESSNEXT Response:

BUSINESSNEXT supports modular, country-wise deployment, allowing each country, business unit, or line of business to adopt only the required modules and capabilities. Features such as Customer 360, Lead Management, Service Management, Marketing, AI, Reports and Dashboards can be enabled based on local business, regulatory, and rollout needs, with role-based access ensuring users see only relevant functionality.

Commercially, licensing is based on the subscribed platform and number of named users, so a reduced country scope may not lower licence costs. However, it can reduce implementation and support effort due to a smaller functional footprint. Final costs will be aligned to the agreed country-wise rollout scope.

Question 11 | GCFS Functional : Could you please share the proposed user access matrix for the system?

It should outline user roles/personas, accessible modules/features, access levels (e.g., view, create, update, approve), and data visibility. Please also indicate differences by business unit, country, region, hierarchy, and any approval or maker-checker controls.

BUSINESSNEXT Response:

CRMNEXT supports a comprehensive Role-Based Access Control (RBAC) framework with configurable user access matrices aligned to enterprise governance standards. Access can be defined at multiple levels, including role/persona, business unit, country, region, branch, department, team, and organizational hierarchy. The platform enables granular permissions such as View, Create, Edit, Delete, Approve, Assign, and Export, with configurable data visibility based on ownership, reporting hierarchy, territories, or customer allocation rules. CRMNEXT also supports maker-checker (four-eyes) approval workflows, delegated approvals, and configurable authorization matrices for business-critical operations. As part of the implementation phase, BUSINESSNEXT will work with Maybank to define and configure a detailed user access matrix in accordance with the bank's security policies, operating model, and regulatory requirements.

The table below represents a sample best-practice access matrix for CRMNEXT application. The final user access matrix will be jointly defined during the implementation phase based on Maybank's operating model, organizational hierarchy, country-specific regulations, and information security policies.

Business Line	User Persona	Primary Responsibilities	Modules Accessible	Access Rights	Data Visibility	Approval Authority
GCFS	Relationship Manager (RM)	Manage corporate customer portfolio, sales, opportunities, service requests	Customer 360, Leads, Opportunities, Accounts, Contacts, Activities, Service Requests, Reports & Dashboards	Create, View, Edit,	Own customers, assigned portfolio, reporting hierarchy, country-specific customers	No
GCFS	Team Leader / Sales Manager	Supervise RMs, monitor pipeline and productivity	Customer 360, Opportunities, Activities, Reports & Dashboards, Service Requests	View, Edit, Assign, Approve	Team portfolio within business unit and country	Yes (as configured)
GCFS	Regional Sales Head	Regional sales oversight	Executive Dashboards, Reports, Customer 360	View, Approve	All customers within assigned region	Yes
GCFS	Product Manager	Product performance and campaign management	Products, Campaigns, Reports, Dashboards	Create, Edit	Country or regional product data	Optional

GCFS	Customer Service Officer	Service request processing	Customer 360, Service Requests, Complaints	Create, View, Update, Close	Assigned queues/customers	No
GCFS	Compliance / Risk Officer	Compliance review and monitoring	Customer 360, CDD, KYC, Audit Logs, Reports	View, Review, Approve	Organization-wide or country-specific based on policy	Yes
GCFS	Operations Team	Operational processing	Tasks, Workflow Queue, Service Requests	View, Update	Assigned workflow queues	No
GCFS	CRM Administrator	Platform administration	Administration, Security, Workflow, Reports, Configuration	Full Administrative Rights	Global (Configuration only)	Yes
GGB	Relationship Manager (RM)	Corporate Banking portfolio management	Customer 360, Leads, Opportunities, Accounts, Activities	Create, View, Edit	Own customer portfolio	No
GGB	Branch Manager	Branch sales supervision	Customer 360, Reports, Activities, Opportunities	View, Assign, Approve	Branch customers	Yes
GGB	Area Manager	Multi-branch management	Dashboards, Reports, Customer 360	View, Approve	Area/Region	Yes
GGB	Service Manager	Customer servicing	Service Requests, Complaints, Customer 360	View, Update, Assign	Branch or service queues	Yes
GGB	Product Specialist	Product advisory	Customer 360, Product Holdings	View	Assigned customers	No
GGB	CRM Administrator	Platform administration	Administration, Workflow, Security	Full Administrative Rights	Global (Configuration only)	Yes

Table 6 : Proposed User Access Matrix

Question 12 | GCFS Functional : For customer key information screen, if business would like to add more fields what is your recommendation? Does it require source codes change?

BUSINESSNEXT Response:

No, CRMNEXT application is configurable. If the Business team would like to add more data fields on Customer 360 view, it can simply be achieved with simple configuration within the application itself. Although, the access to make such configuration changes are limited to Administrator Role only.

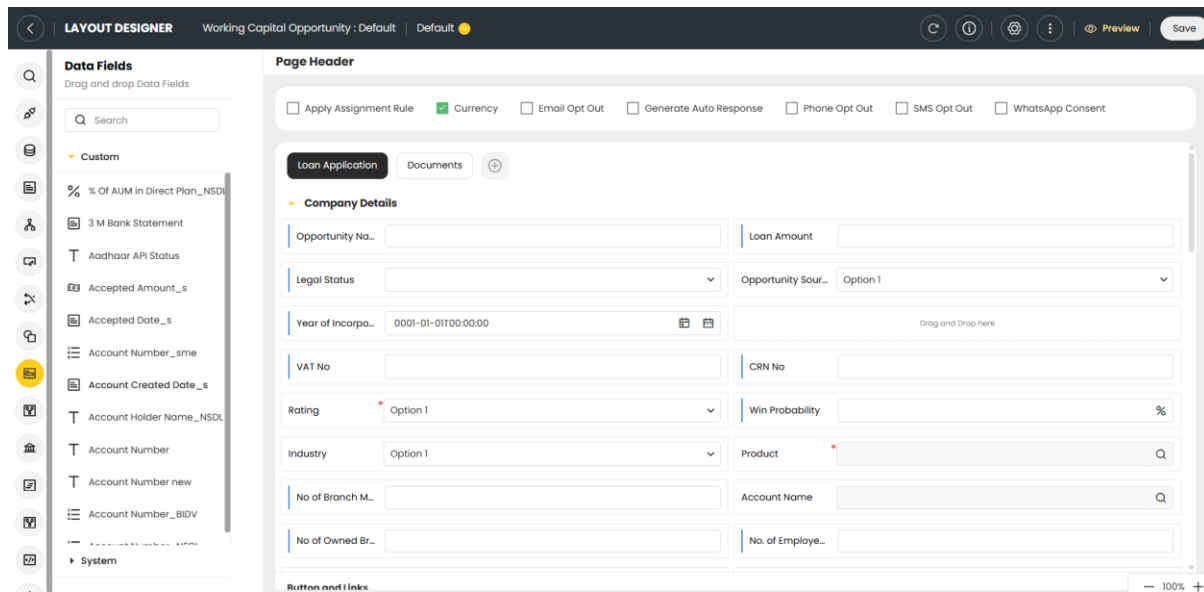

Figure 5 : Form Designer

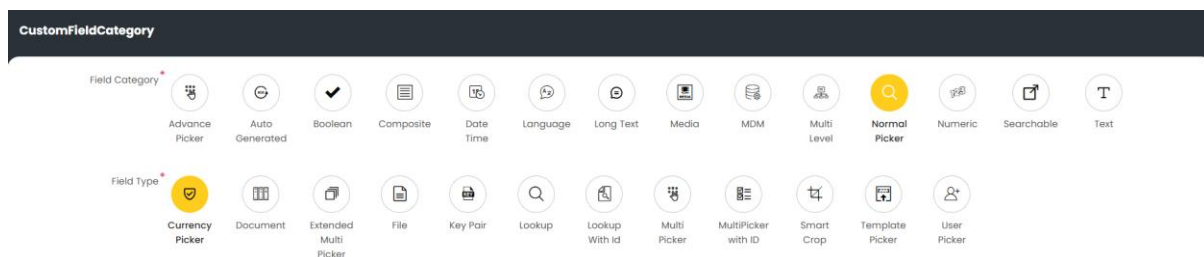

Figure 6 : New Data Field Creation

Question 13 | GCFS Functional : Based on the fictitious scenario below, demonstrate how the CRM platform manages a complex complaint journey spanning multiple months, channels, business units, investigation teams, and external regulators; evolving from a service request to complaint, while maintaining:

1. Single customer view
2. Single case hierarchy and source of truth
3. End-to-end SLA visibility including SLA taken by each unit
4. AI-assisted case management and decision support.

Scenario: A customer receives a fraudulent transaction SMS alert from the bank and calls the Contact Centre to enquire about the alert. She later discovers unauthorized transactions on her credit card and reports the fraud to the bank via Contact Centre who then assigns the case to Authoriser and Fraud Operation teams.

During the investigation that spans 4 months, the customer experiences prolonged delays, limited updates, and late fees charged on the disputed transactions as the case undergoes investigation.

After repeated follow-ups with the bank through multiple channels (multiple calls to Contact Centre, emails to the bank, branch walk-ins), the customer finally escalates the matter externally to regulatory authority. The regulatory body routes the formal customer complaint to CEM. In this formally filed complaint, customer cites multiple allegations, including service attitude encountered in her interaction with staff, processing delays, communication failures/lack of progress updates, and unfair charges on disputed transactions

Vendor to demonstrate:

- ▽ How the CRM platform provides a single end-to-end customer journey view of this case, linking all interactions, service requests, investigations, complaints, SLA commitments, escalations, decisions, and outcomes across the entire lifecycle.
- ▽ AI capabilities in auto-populating the correct multiple complaint categories in the system (for the same case) when CEM captures the escalated complaint in the system.
- ▽ Predictive AI capabilities in detecting when a customer is on the verge of raising a complaint, and/or escalating a complaint to regulatory authorities and mediation bodies (e.g. MAS/FIDReC).

The vendor should ideally explain all the above via a recorded walk-through of the demo platform.

BUSINESSNEXT Response:

We thank you for sharing this comprehensive and well-articulated scenario, which reflects a realistic and operationally complex complaint journey spanning multiple months, channels, business units, investigation teams, and external regulators.

We are confident that our CRM platform is well-positioned to address each of the requirements outlined, including:

- I. A single, unified customer view that consolidates all interactions across the lifecycle;
- II. A single case hierarchy and source of truth that links the service request, its evolution into a complaint, and all related investigations and escalations;
- III. End-to-end SLA visibility, including the SLA consumed by each participating unit; and
- IV. AI-assisted case management and decision support, encompassing auto-population of multiple complaint categories and predictive detection of complaint and regulatory-escalation risk.

Given the breadth and depth of this use case, and our commitment to presenting a thorough, end-to-end demonstration that does full justice to each of the points above, we request until Monday, 6th July to prepare and deliver the complete walk-through. As requested, we will ideally present this via a recorded demonstration of the platform, illustrating the full journey from the initial fraud alert enquiry through to the formal regulatory complaint, resolution, and outcome.

Question 14 | Tech : Do you have any local based support team in MY, SG and Indonesia for the purpose of project implementation/support? – preferably on-site

BUSINESSNEXT Response:

Yes, BUSINESSNEXT has an established presence across Southeast Asia and will provide dedicated implementation and support resources for Malaysia, Singapore, and Indonesia. Depending on the project phase and engagement model, we will deploy a combination of local on-site consultants, regional domain experts, and global product specialists to ensure effective project delivery and ongoing support.

For implementation activities, key functional and technical resources shall be positioned on-site, particularly during discovery, design, UAT, go-live, and hyper care phases, while leveraging offshore delivery presence for accelerated delivery. This hybrid delivery model provides the benefits of local business engagement, faster issue resolution, and direct stakeholder collaboration, while ensuring access to specialized product expertise.

Question 15 | Tech : If the bank decided to go with the approach of zero-copy for data, will the native AI functionality still work?

If it doesn't, then what is the least/minimum amount of data that is required for it to work? Please share the details.

BUSINESSNEXT Response:

BUSINESSNEXT AI Layer can support a zero-copy data approach, provided the AI services are given secure, governed access to the required data at runtime through approved APIs, database views, data virtualization, or query interfaces. In this model, customer and transaction data does not need to be permanently replicated into the BUSINESSNEXT platform; instead, AI models can consume context from the source systems as required, subject to latency, security, masking, and access-control policies defined by Maybank.

However, for native AI functionality to work effectively, the AI layer still requires a minimum contextual dataset to generate accurate recommendations, summaries, predictions, or agentic actions. At minimum, this includes customer/lead identifier, customer profile attributes, product holdings, interaction history, activity/call outcomes, case/service request history, opportunity or sales stage, consent/communication preferences, and relevant business rules or risk indicators. For model training, scoring, personalization, or next-best-action use cases, additional historical outcome data may be required, such as conversion status, campaign response, sales performance, customer engagement patterns, and escalation/resolution outcomes.

Therefore, BUSINESSNEXT can work with a zero-copy architecture, but the required data must be made available through secure real-time or near-real-time access mechanisms. If Maybank does not permit data replication, the recommended approach is to expose only the required fields through governed APIs or controlled data views, with masking/tokenization where required. The final minimum dataset will depend on the specific AI use cases selected, model type, performance expectations, and Maybank's data governance policy.

Question 16 | Tech : Is your proposed solution running only on single CSP or running on multiple CSPs?

If the solution is required to run on multiple CSPs, then please share the detailed architecture diagram and how the handshake is being managed.

Example of multiple CSPs scenario:

Data Storage hosted in CSP 1.

Application processors hosted in CSP 2.

BUSINESSNEXT Response:

CRMNEXT is cloud-agnostic and can be deployed on AWS, Azure, GCP or an on-prem/private-cloud Kubernetes platform; however, for the proposed banking SaaS deployment, the recommended architecture is a **single-CSP, single-tenant deployment** where application services, integration services, database, object storage, logging, monitoring, backup and DR are hosted within the same CSP ecosystem, preferably across primary and DR regions. This approach provides better latency, simplified security governance, lower data transfer cost, clearer audit boundaries and easier operational ownership.

The solution can also support a multi-CSP architecture if required, with application and data layers hosted across different CSPs and connected through secure private connectivity, API gateways, mTLS, encryption, and centralized security controls

For transactional workloads, CRMNEXT recommends avoiding unnecessary split of tightly coupled application and database layers across CSPs unless specifically mandated, as it can introduce latency, egress cost, cross-cloud dependency and operational complexity.

If mandated, we request the Bank to share more details.

Question 17 | GCFS Functional : Wanted to understand why Business Next is not featured in the 2025 Gartner and IDC reports for CRM Customer Engagement.

BUSINESSNEXT Response:

A key limitation of the Gartner CRM Customer Engagement MQ is its industry-agnostic approach; by evaluating vendors across 14 broad verticals, it fails to highlight the specialized capabilities required for a dedicated banking CRM

Inclusion in this specific Magic Quadrant is also gated by revenue criteria across all these verticals which BUSINESSNEXT being a specialized Banking & Financial Services CRM couldn't meet.

Since BUSINESSNEXT's expertise is domain-led in BFSI, we concentrate our analyst participation on the evaluations where our depth is assessed directly and where a buyer gets the most decision-relevant signal, which is precisely why we are rated highest for all customer service and engagement capabilities in the Forrester Financial Services CRM Wave report.

IDC's CRM MarketScapes reports don't have a dedicated financial-services CRM assessment from IDC in recent cycles, which really maps to a BFSI sales-and-engagement CRM platform. Our analyst engagements are focused on reports that are relevant for banking and financial service customers rather than industry-agnostic evaluation reports.

Question 18 | GCFS Functional : What is "Disposition" and "Child Service Request"?

BUSINESSNEXT Response:

Disposition refers to the outcome or status of a customer interaction, service request, or case (e.g., Resolved, Escalated, Pending Customer Response, Closed). It enables standardized tracking, reporting, and analysis of service outcomes.

Figure 7: Sample Disposition Layout

Child Service Request is a subordinate service request created under a parent service request to manage related tasks, dependencies, or specialized actions. It enables complex service requests to be broken down into smaller, trackable activities that can be assigned, monitored, and resolved independently while maintaining linkage to the parent request.

Figure 8: Child Service Request

Question 19 | GCFS Functional : What is the underlying AI engine being used in the Business Next CRM platform? Understood from the start of the presentation that the underlying AI is not Copilot and ChatGPT.

BUSINESSNEXT Response:

CRMNEXT leverages BUSINESSNEXT's AGENTNEXT AI Layer as its underlying AI engine, which is natively embedded within the platform architecture rather than being an external or bolt-on AI solution. AGENTNEXT orchestrates AI-driven capabilities such as conversational AI, agentic workflows, intelligent recommendations, and automation across the CRM platform.

BUSINESSNEXT follows an LLM-agnostic architecture, enabling organizations to leverage the Large Language Model (LLM) of their choice—including OpenAI (ChatGPT), Anthropic Claude, Google Gemini, Azure OpenAI, or other enterprise-approved models—for Generative AI and Agentic AI use cases. This approach provides flexibility to align with enterprise AI strategies, security policies, regulatory requirements, and future technology evolution without being dependent on a single AI provider.

Question 20 | GCFS Functional : When staff updates a customer's address in the CRM platform, will the system also update the details in our core banking system?

BUSINESSNEXT Response:

Yes, CRMNEXT supports bidirectional integration with Core Banking Systems through its configurable integration framework. Updates made within the CRM application can be synchronized with the Core Banking System, and changes from the Core Banking System can likewise be reflected in CRMNEXT, ensuring data consistency across both platforms. Synchronization can be configured using batch-based integrations and, where required, API-based real-time integrations, subject to the bank's integration architecture and operational requirements. The synchronization frequency, business rules, and data exchange mechanisms are fully configurable to align with Maybank's integration strategy.

Question 21 | GCFS Functional : In the Forrester Wave report, Partner Ecosystem for Business Next was rated as "1". Can you please explain what is this and the reason for the rating?

BUSINESSNEXT Response:

The Forrester Wave: CRM Software for Financial Services (Q1 2025) is the single most decision-relevant global evaluation research report for banking and Financial Services. BUSINESSNEXT ranked number 1 for its offerings above all the evaluated vendors globally.

BUSINESSNEXT is the only vendor to score 5/5 for all customer engagement capabilities - Customer 360, customer self-service and customer engagement.

The strategy pillar comprises of 8 criteria among which partner ecosystem being one of the criteria with 10% weightage highlighting that for banking industry it was not very critical from CRM evaluation point of view. For the purpose of evaluation and grading, it was a deliberate choice made on our end to reflect as a vendor who takes complete end-to-end ownership, from product to implementation services to customer success for delivering high impact outcomes and ROI for our customers. In practice, we are always open to work with a partner as per the bank's vision and strategy.

Question 22 | GCFS Functional : How can we group related cases (Service Requests and Complaints) together so we can have an end-to-end view of a complaint?

BUSINESSNEXT Response:

CRMNEXT supports end-to-end case management by allowing related Service Requests and Complaints to be linked using parent-child relationships and configurable case hierarchies. Child Service Requests can be created to manage dependent activities, specialist actions, or investigations while maintaining linkage to the parent case, enabling users to track the complete lifecycle of related requests from a single context.

Additionally, leveraging BUSINESSNEXT's Single Entity Architecture, all customer interactions—including Service Requests, Complaints, activities, communications, and related cases—are consolidated into a unified customer view. This enables relationship managers and service teams to view the complete history, monitor the progress of all linked requests, understand dependencies, and obtain an end-to-end view of a complaint throughout its resolution lifecycle from a single interface.

Question 23 | GCFS Functional : What differentiates your CRM platform from competing solutions in terms of its Complaints Management capabilities/functionality?

BUSINESSNEXT Response:

CRMNEXT differentiates itself through a customer-centric, unified, and highly configurable Complaints Management capability that is natively embedded within the CRM platform rather than being a standalone ticketing solution. Key differentiators include:

- **Unified Customer 360 Context:** Every complaint is managed within the context of a complete Customer 360 profile, giving service users instant visibility into customer relationships, product holdings, interaction history, previous complaints, service requests, and ongoing engagements without switching between applications.
- **Relationship-Aware Complaint Management:** Through BUSINESSNEXT's Single Entity Architecture, complaints can be linked across individual and corporate customers, related parties, and relationship hierarchies, providing a holistic view of customer issues across the enterprise.
- **Parent-Child Case Management:** Supports complex complaint handling through parent-child service requests, allowing multiple investigation tasks, dependent activities, or cross-functional workstreams to be managed independently while maintaining complete end-to-end traceability under a single complaint.
- **Highly Configurable Workflow & SLA Engine:** Complaint routing, assignment, approvals, escalations, and SLA monitoring are fully configurable using BUSINESSNEXT's workflow engine. Rules can be defined based on complaint category, product, customer segment, geography, business unit, priority, regulatory requirements, or organizational hierarchy without custom development.
- **Intelligent Routing & Automation:** Complaints can be automatically assigned to the appropriate teams or users based on configurable business rules such as skills, geography, queues, product, complaint type, branch, or workload. Automated reminders, escalations, notifications, and follow-up tasks help ensure SLA adherence and operational efficiency.
- **Omnichannel Complaint Capture:** Complaints originating from branch, contact center, relationship managers, email, web portals, mobile applications, social channels, or integrated third-party systems are consolidated into a single case management framework, ensuring a consistent servicing experience across channels.
- **Embedded Collaboration:** Internal teams can collaborate through activities, notes, tasks, approvals, and workflow-driven actions within the complaint lifecycle. Where external business units or users do not have CRM access, configurable email-based notifications and integrations with enterprise systems ensure seamless coordination while maintaining a complete audit trail within CRMNEXT.

- **Complete Governance & Auditability:** Every complaint lifecycle event—including ownership changes, escalations, workflow transitions, approvals, communications, and administrative updates—is fully auditable, supporting regulatory compliance and operational governance.
- **Actionable Operational Insights:** Supervisors and management benefit from configurable dashboards and reports that provide real-time visibility into complaint volumes, SLA compliance, aging, turnaround times, root-cause trends, resolution performance, backlog analysis, and team productivity, enabling proactive service management and continuous process improvement.

Question 24 | GCFS Functional : What is the accuracy rate of your AI-driven complaint categorisation capability? Specifically, how accurately can the AI classify complaints into the appropriate taxonomy categories at both the Major (Parent) category level and Minor (Child) sub-category levels?

BUSINESSNEXT Response:

CRMNEXT supports AI-driven complaint categorisation using a combination of natural language understanding, historical complaint learning, configured complaint taxonomy, channel context, customer/product context, and confidence-score based classification. The accuracy of classification depends on the quality of historical complaint data, clarity of the Bank's complaint taxonomy, number of categories/sub-categories, language mix, complaint description quality, and availability of labelled training data. In typical banking implementations, the AI model is expected to achieve higher accuracy at the Major / Parent category level, generally in the range of 85%–90% after training and tuning, while Minor / Child sub-category classification is typically more granular and may range around 75%–85%, subject to data quality and taxonomy complexity. CRMNEXT does not rely on blind automation; each AI classification is generated with a confidence score, and records falling below the agreed confidence threshold can be routed for manual validation by users or supervisors. The model can continuously improve through feedback, correction, retraining, and periodic validation against actual complaint outcomes. Final accuracy levels will be jointly benchmarked during implementation / PoC using the Bank's own historical complaint data, approved taxonomy, language samples, and acceptance criteria before production rollout.

Question 25 | GCFS Functional : How do you group related cases (service requests and/or complaints) together in an audit trail for a single case? For example, customer makes multiple calls over several months on the same issue, how do we link these cases together?

BUSINESSNEXT Response:

Yes, CRMNEXT provides a comprehensive case relationship and audit capability that enables related Service Requests and Complaints to be grouped together under a single parent case, providing a complete end-to-end view of the customer's issue. Through its parent-child case management framework, subsequent requests, follow-up investigations, escalations, or dependent activities can be created as Child Service Requests and linked to the original (Parent) case. The parent case provides a consolidated view of all associated child requests, including their status, assignee, priority, SLA, and resolution progress, allowing users to monitor the complete lifecycle of a customer issue from a single screen.

In scenarios where a customer contacts the bank multiple times over the same issue across several weeks or months, new interactions can either be logged against the existing complaint or linked as child requests to preserve continuity rather than creating isolated cases. Every interaction—including calls, emails, branch visits, activities, notes, tasks, approvals, workflow actions, and communications—is automatically maintained as part of the case audit trail. In addition, leveraging BUSINESSNEXT's Single Entity Architecture and Customer 360, all related Service Requests, Complaints, customer interactions, activities, communications, and case history are consolidated into the customer's 360-degree profile. This enables relationship managers and service teams to view the complete chronology of customer engagements, understand the history of recurring issues, identify linked cases, and obtain a holistic view of the customer's servicing journey while maintaining full traceability and auditability throughout the complaint lifecycle.

Thank You

Maybank Queries and Clarifications

Thank you for the opportunity to present our responses to Maybank's queries and clarifications. We appreciate the Bank's time, evaluation effort, and continued engagement throughout this process.

BUSINESSNEXT remains committed to supporting Maybank with a secure, scalable, open, and future-ready platform for enterprise-wide CRM transformation. We look forward to the opportunity to partner with Maybank in the next phase of this journey.
